

NOVA WALSETH

nova@walseth.me – (262) 327-0659 – San Francisco, CA – <https://nova.walseth.me>

WORK EXPERIENCE

12twenty

September 2024 – September 2025

Software Engineering Lead

Remote

- Improved snapshot testing tooling, resulting in a 75% reduction in testing and deployment time, and a better developer experience through easier test creation and maintenance.
- Enhanced code quality and documentation through code reviews for more than 10 developers, simplifying technical documents and promoting clear, efficient code.
- Planned long-term application improvements in weekly architecture meetings with fellow dev leads and the VP of Engineering, for Azure based C#, TypeScript, SQL, and legacy Angular JS code, resulting in significant performance and workflow improvements.
- Led sprint planning and project management, coordinating tasks, and managing timelines for 20 sprints.

Microsoft

July 2021 – October 2023

Senior Software Engineer

Remote

- Developed campus transportation app using TypeScript and C# for 50k Microsoft employees at the Redmond location.
- Enhanced user experience for Microsoft Viva Connections by fixing 100 or more bugs.
- Pioneered applications for Microsoft Viva Connections and pushed further requirements for Adaptive Card Extensions.
- Maintained code quality and system stability through 20+ code reviews per week, bug fixes, unit testing, and documentation.

Google

May 2019 – November 2020

Software Engineer

Sunnyvale, CA

- Spearheaded development for the GCP BigQuery Row Level Security feature using Java, JavaScript, Python, and C++.
- Integrated new IAM policies to be checked on query, targeting less than 5% drop in query performance.
- Modified GCP Bigquery front-end using AngularJS adhering to high quality expectations for GCP to support thousands of companies.
- Expanded ZetaSQL by adding new features to core parser in C++.

Brady Corporation

August 2017 – May 2019

Software Engineer

Milwaukee, WI

- Expanded existing cloud inspection management software, worked directly with onsite inspector to optimize inspection workflow and used inspector input to write and prioritize user stories.
- Collaborated with team on both C# ASP.NET web app to allow easy management of scheduling inspections and React Native/Cordova mobile app for easy onsite inspection with phone or tablet.
- Shifted the culture to support using lightweight microservices in Azure. Using serverless functions over traditional web jobs when applicable to save thousands of dollars per month.
- Primary developer for desktop application using WPF to allow communication between web front-end and propitiatory printer drivers.

EDUCATION

Milwaukee School of Engineering

BS Software Engineering

September 2013 – May 2017

Milwaukee, WI

SKILLS

- Programming Languages: C#, TypeScript, SQL, Rust, Java, C++, Python
 - Development Experience: Cloud Architecture (Azure, AWS, GCP, Cloudflare), Web Development (Angular, React, Vue, C# ASP .NET, NodeJS), Mobile Application (Cordova, React Native), Desktop Application (C# WPF), Scripting/Command Line Utilities (TypeScript, Python), Microservices, Developer Experience (Docker, Docker Compose, Cross Platform Tooling), Serverless (C# Azure Functions), CI/CD pipelines (Azure DevOps, Github Actions), ML/AI (ML course in college, Azure Document Intelligence OCR), Security and Privacy, Testing
-

PROJECTS

Smart Console Raspberry Pi, React, TypeScript <https://github.com/Awkewainze/SmartConsole>

A touchscreen based IOT app that shows basic information about local devices and current conditions, including current time, weather, ability to control lights, and see moisture level of houseplants using moisture sensors.

Friendbot TypeScript <https://github.com/Awkewainze/FriendBot>

A simple, silly Discord.js chatbot used for fun activities and as a way to teach 2 less experienced friends how to code. Was an experiment with trying different design patterns in TypeScript: dependency injection, permission system/roles, commands.

IoT Traffic Light Arduino, Raspberry Pi, Soldering

Recently learned how to solder to build a simple ESP WIFI controlled traffic light to indict personal status (home, do not disturb, away). Integrating into existing HomeAssistant environment.
